Compte rendu :

This September Apple released the new iPhone 15. This new model of iPhone gets a lot of changes. The major change is the USB-C port now available on all Apple's devices. The new port upgrades the speed of data transfer to 480 mbp/s for the basic iPhone 15 and 10 gbp/s for the Pro. Along with the USB-C, all models have a Dynamic Island. This feature is useful for seeing all passive information like alarms, timer, flight information, live sports games without having to hop into an app itself. Apple has announced its photonic computational photography engine for nicer photos. The new GPU is the « biggest redesign in the history of Apple GPUs » with 20 percent speed over its predecessor, Apple says we can play console games like Resident Evil Village on the new models. One of the biggest changes is the 120 Hz frame rate for the screen of the Pro and still for the Pro an Action button, we can use this button for : muting the phone, turn the flashlight or take a photo with the camera open. The price of the new iPhone is 799\$ for the 15, 899\$ for the Plus and 1199\$ for the Pro.

1 ) différence :

The data transfer : 480 mbp/s for the standard and 10 gbp/s for the Pro if we buy our own cable

Size : the standard and the Plus get the same size as their predecessor

Performance : the Pro powered by the A17 chipset which promises 10 percent faster

Frame rate : the Pro gets 120 Hz to the screen

Action button : only on the Pro, is useful for muting the phone, turn the flashlight or take a photo with the camera open

2 ) main novelties

the USB-C, the data transfer, the new GPU and the Dynamic Island
